Module – 1 (SDLC)

==========

1) What is Software?

A software is a set of instructions, data or program used to operate computers and execute specific tasks.

---

2) What are the types of Applications?

The types of application are:

- Web Development
- Game Development
- Machine Learning and Artificial Intelligence
- Data Science and Data Visualization

1) Web Development:
   Web development is the field of writing computer applications to create interactive websites, usually using hypertext markup language and a browser. A web developer is a computer programmer who creates and maintains a website or other web applications.
2) Game Development:
   Python is a programming language that can be used for game development. It is a programming language that can be used to make video games and can be used to control the actions of the games characters and elements.
3) Machine Learning and Artificial Intelligence:
   These technologies are the best methods to analyze the large amounts of data available in the machine. With the

new technologies, we can analyze the data, and give recommendations to the company.

4) Data Science and Data Visualization:
Python is perfect for data visualization because it provides many ready-to-use functions and modules foe data visualizations. Data science uses powerful techniques like machine learning to process data into usable forms.

---

3) What is programing?

Python is a popular general-purpose programming language. It is used in machine learning, web development, desktop applications and many other.

---

4) What is Python?

Python is an interpreted, object-oriented, high-level programming language with dynamic semantics.
